A TIC TAC TOE GAME WITH PYTHON3

AKSHAY KUMAR
0177CS161018
ICOT - CSE

REQUIREMENTS:

Here are the requirements:

- 2 players should be able to play the game (both sitting at the same computer)
- The board should be printed out every time a player makes a move
- You should be able to accept input of the player position and then place a symbol on the board

WALKTHROUGH STEPS WORKBOOK:

- Step 1: Write a function that can print out a board. Set up your board as a list, where each index 1-9 corresponds with a number on a number pad, so you get a 3 by 3 board representation.
- Step 2: Write a function that can take in a player input and assign their marker as 'X' or 'O'. Think about using *while* loops to continually ask until you get a correct answer.
- Step 3: Write a function that takes in the board list object, a marker ('X' or 'O'), and a desired position (number 1-9) and assigns it to the board.
- Step 4: Write a function that takes in a board and a mark (X or O) and then checks to see if that mark has won.
- Step 5: Write a function that uses the random module to randomly decide which player goes first. You may want to lookup random.randint() Return a string of which player went first.

WALKTHROUGH STEPS WORKBOOK:

- Step 6: Write a function that returns a boolean indicating whether a space on the board is freely available.
- Step 7: Write a function that checks if the board is full and returns a boolean value. True if full, False otherwise.
- Step 8: Write a function that asks for a player's next position (as a number 1-9) and then uses the function from step 6 to check if it's a free position. If it is, then return the position for later use.
- Step 9: Write a function that asks the player if they want to play again and returns a boolean True if they do want to play again.
- Step 10: Here comes the hard part! Use while loops and the functions you've made to run the game!

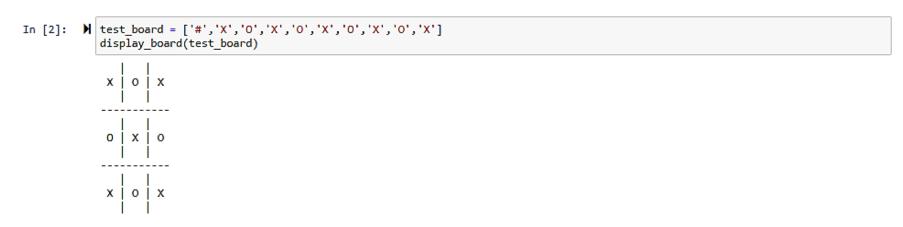

Not Trusted

Python 3 C

Milestone Project 1: Full Walk-through Code

Step 1: Write a function that can print out a board. Set up your board as a list, where each index 1-9 corresponds with a number on a number pad, so you get a 3 by 3 board representation.

TEST Step 1: run your function on a test version of the board list, and make adjustments as necessary

Step 2: Write a function that can take in a player input and assign their marker as 'X' or 'O'. Think about using while loops to continually ask until you get a correct answer.

```
In [3]: M

def player_input():
    marker = ''

while not (marker == 'X' or marker == '0'):
    marker = input('Player 1: Do you want to be X or 0? ').upper()

if marker == 'X':
    return ('X', '0')
    else:
        return ('0', 'X')
```

TEST Step 2: run the function to make sure it returns the desired output

Step 3: Write a function that takes in the board list object, a marker ('X' or 'O'), and a desired position (number 1-9) and assigns it to the board.

TEST Step 3: run the place marker function using test parameters and display the modified board

Step 4: Write a function that takes in a board and checks to see if someone has won.

```
In [7]: Mode win_check(board,mark):

return ((board[7] == mark and board[8] == mark and board[9] == mark) or # across the top
(board[4] == mark and board[5] == mark and board[6] == mark) or # across the middle
(board[1] == mark and board[2] == mark and board[3] == mark) or # across the bottom
(board[7] == mark and board[4] == mark and board[1] == mark) or # down the middle
(board[8] == mark and board[5] == mark and board[2] == mark) or # down the middle
(board[9] == mark and board[6] == mark and board[3] == mark) or # down the right side
(board[7] == mark and board[5] == mark and board[3] == mark) or # diagonal
(board[9] == mark and board[5] == mark and board[1] == mark)) # diagonal
```

TEST Step 4: run the win check function against our test board - it should return True

Step 5: Write a function that uses the random module to randomly decide which player goes first. You may want to lookup random.randint() Return a string of which player went first.

```
In [9]: N import random

def choose_first():
    if random.randint(0, 1) == 0:
        return 'Player 2'
    else:
        return 'Player 1'
```

Step 6: Write a function that returns a boolean indicating whether a space on the board is freely available.

```
In [10]: M def space_check(board, position):
    return board[position] == ' '
```

Step 7: Write a function that checks if the board is full and returns a boolean value. True if full, False otherwise.

Step 7: Write a function that checks if the board is full and returns a boolean value. True if full, False otherwise.

*Step 8: Write a function that asks for a player's next position (as a number 1-9) and then uses the function from step 6 to check if its a free position. If it is, then return the position for later use. *

```
In [12]: M def player_choice(board):
    position = 0

while position not in [1,2,3,4,5,6,7,8,9] or not space_check(board, position):
    position = int(input('Choose your next position: (1-9) '))

return position
```

Step 9: Write a function that asks the player if they want to play again and returns a boolean True if they do want to play again.

Step 10: Here comes the hard part! Use while loops and the functions you've made to run the game!

Step 10: Here comes the hard part! Use while loops and the functions you've made to run the game!

```
In [14]:  print('Welcome to Tic Tac Toe!')
             while True:
                 # Reset the board
                 theBoard = [' '] * 10
                 player1_marker, player2_marker = player_input()
                 turn = choose_first()
                 print(turn + ' will go first.')
                 play_game = input('Are you ready to play? Enter Yes or No.')
                 if play_game.lower()[0] == 'y':
                     game_on = True
                 else:
                     game_on = False
                 while game on:
                     if turn == 'Player 1':
                         # Player1's turn.
                         display_board(theBoard)
                         position = player_choice(theBoard)
                         place_marker(theBoard, player1_marker, position)
                         if win_check(theBoard, player1_marker):
                             display_board(theBoard)
                             print('Congratulations! You have won the game!')
                             game on = False
                         else:
                             if full board check(theBoard):
                                 display_board(theBoard)
                                 print('The game is a draw!')
                                 break
                             else:
                                 turn = 'Player 2'
```

```
turn = 'Player 2'
    else:
        # Player2's turn.
        display_board(theBoard)
        position = player_choice(theBoard)
        place_marker(theBoard, player2_marker, position)
        if win_check(theBoard, player2_marker):
            display_board(theBoard)
            print('Player 2 has won!')
            game on = False
        else:
            if full_board_check(theBoard):
                display_board(theBoard)
                print('The game is a draw!')
                break
            else:
                turn = 'Player 1'
if not replay():
    break
```

Congratulations! You have won the game! Do you want to play again? Enter Yes or No: No

THANKYOU
